

YugabyteDB

SDET Intern — Placement Prep Brief

B.Tech 2026 Batch · CSE / IT / CS&CE; / CS&SE; · June 2026

■ COMPANY OVERVIEW

Yugabyte Inc. (founded 2016, Sunnyvale CA) is the company behind **YugabyteDB** — the open-source, PostgreSQL-compatible, distributed SQL database built for global, internet-scale applications. Inspired by Google Spanner, it pairs auto-sharding, per-shard Raft consensus replication, and multi-shard ACID transactions with familiar PostgreSQL APIs. As of early 2026, the company has raised **\$393M in total funding**, holds a valuation of **\$1.3B**, and employs ~423 people across 5 continents.

In 2025–26, Yugabyte signed a **Strategic Collaboration Agreement with AWS**, released PostgreSQL 15 compatibility updates, and was named in the 2026 Gartner Peer Insights Voice of the Customer report with a 98% willingness-to-recommend score. The transactional database market is projected to reach **\$64B by 2025** — YugabyteDB is squarely positioned for that growth.

■ HIRING PROCESS (4 Rounds)

Round 1 — Online Coding Test (HackerEarth / internal platform)

2–4 DSA problems to be solved in 60–90 minutes. Difficulty: medium-hard. Focus: arrays, trees, graphs, dynamic programming, string manipulation.

Round 2 — Technical Interview (Testing + CS Fundamentals)

Questions on SDLC, testing theory (unit / integration / system tests), automation frameworks, and basic distributed systems / database concepts. Expect 1–2 SQL queries.

Round 3 — Technical Deep-Dive (Project / Resume Round)

Walk through your best project. Interviewers probe design choices, bottlenecks, and how you'd test it. Candidates report this round is the hardest.

Round 4 — HR / Values Round

Why Yugabyte? Why SDET? Long-term goals. Culture-fit questions.

■ Average time-to-offer: ~10 days. Process is entirely virtual.

■ TECHNICAL STACK

Core Languages: Python · Java · C++ (C++ is the primary database implementation language)

Database / Query Layer: PostgreSQL (YSQL) · Apache Cassandra API (YCQL) · SQL · CQL

Distributed Systems Concepts: Raft Consensus · Google Spanner-inspired architecture · auto-sharding · multi-region replication · ACID transactions

Testing Tools / Frameworks: Custom automation frameworks · REST Assured · CI/CD pipelines · TPCC / Sysbench benchmarks · chaos / fault-injection testing

Infrastructure & Cloud: Kubernetes · AWS · GCP · Azure (YugabyteDB runs on all three) · Docker

Nice-to-Have: Knowledge of database internals (B-tree, transactions, recovery, query processing) · Change Data Capture (CDC) · Raft paper familiarity

■ RECENT NEWS (2025–2026)

• **AWS Strategic Collaboration (2025):** Yugabyte signed an SCA with AWS, signalling deep cloud-native investment — intern work will touch AWS deployments.

- **PostgreSQL 15 Compatibility (Jan 2025):** YugabyteDB levelled up PG15 features + seamless upgrades — SDET interns will test this compatibility layer.
- **Gartner Peer Insights 2026:** Yugabyte earned 98% willingness-to-recommend and 4.7/5 from 40 enterprise customers — product quality is centre-stage.
- **Distributed SQL Summit (DSS 2025):** Annual flagship event held in Nov 2025; seventh edition. Strong community + open-source momentum.
- **423 employees, \$393M raised (Feb 2026):** Lean team — interns get real ownership, not busywork. PPO conversion is performance-based.

■ ELIGIBILITY CRITERIA

Graduating Batch: 2026 (B.Tech / B.E.)

Eligible Branches: CSE · CS&CE; · CS&SE; · IT (core CS/IT only)

CGPA Cutoff: **8.50 or above** — strictly enforced

Backlogs Policy: **Zero backlogs** permitted at time of application

Stipend: ■80,000 per month

CTC (PPO): ■21,00,000 LPA + Stock Options (*verify exact figures with official offer letter*)

Duration: 12 months preferred (minimum 6 months) | **Location:** Bangalore or Pune (on-site, Mon–Fri)

Selection Route: Online Test → Technical Interviews → HR (shortlisting from registered list; not all applicants get the test link)

■ 5 TARGETED PREP TIPS

Tip 1 — Master DSA at Medium–Hard level. The online test has 2–4 problems in 60–90 min. Practise trees, graphs, DP, and sliding-window problems on LeetCode. Target 150+ problems before the test.

Tip 2 — Learn SQL deeply + write real queries. YugabyteDB is PostgreSQL-compatible. Practice JOINS, window functions, CTEs, and EXPLAIN ANALYZE. Try installing YugabyteDB locally (free) and run queries on it.

Tip 3 — Build (and be able to test) an automation project. Write a Python/Java test framework for any REST API or database. Demonstrate you understand unit, integration, and system test boundaries — this is the core SDET skill.

Tip 4 — Read the Raft Consensus paper + YugabyteDB architecture blog. Interviewers reward candidates who understand *why* distributed systems are hard: network partitions, consistency vs. availability, replication lag. Even a surface-level grasp of Raft sets you apart.

Tip 5 — Prepare your project walkthrough as a test-design story. Don't just describe what you built — explain how you'd test it: what you'd mock, which edge cases matter, and how you'd automate regression. This maps directly to what the YugabyteDB SDET team does every day.
